

PicoID Guide

v1.15 - by Mhortai

PicoID lists every proc imprinted on your equipped items - the proc's name, its spell ID, the item it originally comes from, and where that item drops. It is a viewer only: it reads, it never changes anything on your character.

Opening The Window

Any of these:

- Click the spyglass button on the minimap.
- Type /picoid or /pid.
- Interface -> AddOns -> PicoID -> "Open PicoID".

Esc or the X closes it. Drag the title area to move it; drag the grip in the bottom-right corner to resize. "Reset" restores the default size and position.

The Columns

- **Item** - The equipped item carrying the proc (with its icon).
- **Imprinted proc** - The proc's name (with its spell icon).
- **Proc ID** - Its spell ID (white). Click a row to insert "[Proc Name] (ID)" into a chat box you already have open - handy for linking a proc to someone. Shift-click inserts just the bare ID number.
- **Item of origin** - The item this proc originally belongs to (with its icon when the server names a single unambiguous source item; multi-source procs show text only).
- **Dropped by** - Where that item comes from (boss, crafted, vendor, quest...).

Click a COLUMN HEADER to sort by that column; click it again to reverse, and a third time to go back to gear order. The small FILTER BOX in the bottom-right corner narrows the list as you type - it matches any column (item, proc, ID, origin, source). Esc clears it. The totals line always describes your full gear set, filtered or not.

RED ROWS are duplicated procs: the same proc imprinted on two or more of your equipped items. A duplicated proc never fires twice - the extra copies are wasted, which is exactly what this window exists to catch. The totals line at the bottom counts your items, procs, and duplicates.

Hover: Damage, Healing, And What Scales It

Hovering a row shows everything about that proc:

- "Approx. ... with your stats" - what it would actually hit for with your

current stats. This figure comes from the server, once per hover. If the server is busy it may drop the request - the tooltip then stays at "Calculating with your stats..." and simply hovering again later asks once more. This is deliberate: the realm meters how fast addons may talk to it, and PicoID never repeats a request on its own.

- The full effect at its imprinted magnitude - the spell's description with

its numbers rewritten to what this bound copy does, the same preview the Dashboard's extraction window shows. This covers healing as well as damage, and hybrid procs show both.

- What scales it - whether ranks raise the proc, and the spell power /

attack power percentages it scales with, straight from the server's per-proc facts.

For the same reason, the list itself refreshes from the server at most once every 10 seconds. The Refresh button re-renders instantly from what is already known; a full re-ask only goes out when that window has passed.

Sharing Your Procs (Pico Strings)

The Share button (top bar) opens a dialog that works in both directions, like sharing a talent build:

- YOUR STRING - the top box holds a compact "PICO1:..." string of your

procs, pre-selected. Press Ctrl+C and paste it anywhere: Discord, the forum, an in-game mail or chat line.

- A FRIEND'S STRING - paste it into the lower box and press View (or

Enter). A read-only popup opens with their full proc list - names, origins, drop sources and duplicate highlighting, exactly like your own window. Clicking a row inserts the proc into your open chat box.

Notes:

- The string carries only ID numbers; both sides' own PicoID rebuilds the

names locally. Nothing is sent to or through the server - sharing is pure copy-and-paste.

- In-game chat cuts messages at 255 characters. A small gear set fits in

one line; a large one may not - Discord or in-game mail keep any length intact. A cut or mangled string is detected and named, never shown as a half gear set.

- Damage figures are not shown for shared lists - "with your stats" only

means something on your own gear.

Options

Interface -> AddOns -> PicoID:

- Show minimap button (drag the button itself to move it around the map)
- Font size and window opacity sliders

/picoid debug prints a short internal status readout.

THE PicoID DATA ADDON

Proc names and origins come from a companion addon, "PicoID Data", which loads itself only when first needed. Leave it ticked in the AddOns list at the character screen - if it is unticked, the origin columns stay blank and PicoID will tell you to re-tick it.

The Print Button

Print opens the list as plain text, pre-selected for Ctrl+C, and also saves it to SavedVariables (WTF\...\PicoIDExport.lua) on logout - useful for pasting into a spreadsheet or a forum post.

Changelog

PicoID - Changelog

- =====

1.15

- PICO share strings: the new Share button (top bar) builds a compact "PICO1:..." string of your equipped procs to copy and paste anywhere; pasting a friend's string into the same dialog and pressing View opens a read-only popup of their procs - names, origins, drop sources and duplicate highlighting rebuilt from your own local PicoID Data tables. Entirely offline: nothing is ever sent on the addon pipe, so the server throttle is untouched. Strings are version-tagged and checksummed - a chat-truncated or mangled paste is detected and named instead of showing half a gear set. (Direct addon-to-addon delivery is deliberately not included; it needs the server admin's sign-off on player-to-player addon traffic first.)
- Icons: the Item, Imprinted proc and Item of origin columns now show their icons at the left of the text. Origin icons come from ICIPROCSRC, a verb the server has been sending in the ICINV stream all along (the sole item carrying the proc, sent only when unambiguous) that PicoID previously ignored -- multi-source procs stay

text-only by design. Origin ids ride the PICO string too, so shared lists show them as well.

- Hover now shows the proc's full effect -- damage AND healing, hybrids show both -- with its numbers rewritten to the imprinted soulforge magnitude, exactly the way the Dashboard's extraction window previews a proc (stock description x server-sent base values x magnitude; fully client-side).
- Hover also states the proc's scaling coefficients, from the ICIPROCFAC facts the server already sends per proc: whether ranks raise it, and the spell power / attack power percentages it scales with.
- Sortable columns: click a header to sort by it, again to reverse, a third time to restore gear order.
- Filter box (bottom-right): typing narrows the list live, matching any column. Esc clears it. Totals still describe the full gear set.
- Shift-click a row to insert just the proc ID into an open chat box (plain click still inserts "[Proc Name] (ID)").
- First user manual (MANUAL.txt).
- Window title shortened to make room for the Share button.

1.14

- Server-throttle rework (by the server admin, adopted as the live baseline): * USPELLDMG damage is fetched once, on hover, for the hovered proc only, with a 6s timeout that clears the "asked" flag but never re-sends on its own. The old twice-a-second retry pump (which overran the per-account token bucket) is gone. * The prefetch that fired at login and on every gear change (window closed) is removed. * ICINV is debounced to one request per 10s (it costs 6 tokens on the pipe). * The 810 KB proc/drop tables moved to a separate LoadOnDemand addon, PicoIDData, pulled in by EnsureData() on first use, so players who never open the window never parse them. PicoIDData must stay force-enabled in the launcher manifest. * The USPELLDMGR tooltip repaint now requires PicoID's own row tag, so it can no longer overwrite Uncapped's item tooltips. * The empty-state message now asks UncappedThrottle and reports a dropped request.
- Author corrected to Mhortai.

1.13

- Click a proc row to insert "[Proc Name] (ID)" into your active chat box.
- Totals line at the bottom: items, procs, and how many are duplicated.
- Duplicated procs now also get a red row background, not just red text.

1.12

- Potency: re-requested unanswered figures (superseded by the 1.14 hover model).
- Dropped by: manual sources for Speed Infusion (Mythic Legendary Bags), the Wraith Scythe Drain Life (World Drop), Turalyon's (Vendor), Manslayer (Hakkar).

1.11

- "Dropped by" now covers every proc: set bonuses show "Vendor", quest items show "Quest", plus the existing boss / crafted / sold-by sources.

1.10

- Opening the window requests the imprint data from the server immediately (ICINV).

1.9

- "Dropped by" also shows "Crafted (Profession)" or "Sold by <NPC>".

1.8

- Removed the hidden spell-description scanning tooltip (it disturbed imprint/vestige lines other addons draw on item tooltips). Hover uses the server number only.

1.7 and earlier

- Duplicate-proc red highlight, "Dropped by" column, proc hover potency, InvID-style columns, Print/export, minimap button, options panel, and initial release.
