

PicoID 1.14 + 1.15 — in a nutshell

by Mhortai

PicoID lists every proc imprinted on your equipped gear — name, spell ID, the item it originally comes from, and where that item drops — and flags duplicated procs in red (a proc imprinted twice never fires twice, so the extra copy is wasted). Open it with the minimap spyglass or **/pid**. Here's what the last two versions brought.

1.14 — leaner, politer, faster

A big under-the-hood rework, done together with the realm, around how PicoID talks to the server:

- **Hover for damage.** Hovering a proc row asks the server what it would hit for *with your current stats* and shows it in the tooltip. It asks once, exactly when you hover — no more background chatter. If the server is busy that moment, just hover again a bit later.
- **Much lighter on login.** The big proc/origin tables moved into a companion addon, **PicoID Data**, that loads only when you actually open the window. One thing to remember: **keep “PicoID Data” ticked** in your AddOns list — unticked, the origin columns stay blank.
- **Honest empty state.** If the list is empty because the server dropped the request, the window now says exactly that (instead of blaming the wrong addon) — reopen shortly and it fills in.
- **Small fixes.** No more overwriting other addons' item tooltips; clicking a row no longer force-opens the chat box and steals your WASD keys; Print output no longer grows forever in your saved variables.

1.15 — share your procs: PICO strings

Share your full imprint list with any other PicoID user, the way people trade talent-calculator links. Hit the new **Share** button at the top of the window:

- **Show yours:** the dialog opens with your PICO string pre-selected — Ctrl+C and paste it anywhere: Discord, the forum, an in-game mail or a chat line.
- **See theirs:** paste a friend's string into the lower box and press **View** — a read-only popup opens with their whole list: names, origins, drop sources, duplicate highlighting, just like your own window. Click a row to link a proc in chat.

```
PIC01:Mhortai:1=50730=16414.35,58386.20|16=50427=67188.50!52327
```

The string carries only ID numbers — your own PicoID fills in the names locally, so even a huge gear set stays a few hundred characters, and nothing is ever sent to the server. Every string is checksummed: a cut or mangled paste (in-game chat trims at 255 characters — long strings travel better via Discord or mail) is politely rejected instead of showing half a gear set.

- **Icons everywhere:** the item, the proc, and the item it originally comes from now all show their icons in the list - in your window and in shared lists alike.
- **Healing on hover:** the hover tooltip now shows a proc's full effect - damage AND healing, hybrids show both - at its imprinted soulforge magnitude, the same preview the extraction window gives, plus what actually scales it (ranks, spell power, attack power).
- **Quality of life:** click a column header to sort (again to reverse, a third time for gear order); a filter box in the bottom-right narrows the list as you type; Shift-click a row to grab just the bare proc ID. 1.15 also ships with a proper user manual.

On the workbench for coming versions

- **One-click in-game sharing.** Send your PICO string directly to another player: they'd get a clickable “[Mhortai's PicoID — click to view]” line in chat, no copy-paste needed. Nothing opens by itself, and incoming shares can be switched off entirely.

Designed and waiting on a server-side green light — no promises on timing. Until then, the copy-paste strings in 1.15 work everywhere, today.
